## EXECUTING A DOE:

A FEW WAYS TO KILL AN EXPERIMENT
Emily Nichols
March 8, 2013

## Why Should You Care About DOE's?

$\square$ An academic reason
$\square$ Better than COST approach
$\square 4$ other compelling reasons
$\square$ Directly applicable to your career
$\square$ Can make you a superstar
$\square$ Theory not difficult
$\square$ Takes creativity and imagination

## Let's Talk Muffins

$\square$ Non-trivial topic: chemistry is involved
$\square$ Ingredients are easily available, low cost
$\square$ Can be done in your kitchen
$\square$ Lots of $y$-variables
$\square$ Lots of potential disturbances

## Choosing a Good Recipe

## Dry Ingredients Wet Ingredients

Mix dry ingredients and chocolate chips. Combine

11/3C flour
3 tsp. baking powder
$1 / 4$ tsp salt
$1 / 2$ C chocolate chips
$1 / 2 C$ sugar
1 egg
1 C milk
$1 / 3 \mathrm{C}$ vegetable oil

## Directions

 sugar with oil. Then add egg \& milk. Stir wet ingredients into flour mixture. Do not beat. Bake @ 375o for 20-25 min.
## A Few Good Factors

$\square$ Flour type

Baking powder amount
$\square$ Vegetable oil amount

$\square$ Mixing time

## Make it Feasible, Make it Work

$\square 1 / 2$ fraction in 4 factors is 8 batches of muffins that's going to take way too long!

## Make it Feasible, Make it Work

$\square 1 / 2$ fraction in 4 factors is 8 batches of muffins that's going to take way too long!
$\square$ Ok, we'll make 2 batches at a time...

## Make it Feasible, Make it Work

$\square 1 / 2$ fraction in 4 factors is 8 batches of muffins that's going to take way too long!
$\square$ Ok, we'll make 2 batches at a time...

## Consider Disturbances

$\square$ Pour Order \& Pan Location

## Randomize!

| Run | Flour Type | Baking Power | Mixing Time | Operator | Egg Size | Oven Location |  | P1 | P2 | P3 | P4 | P5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  |  |  |  |  | Front | Pour Order | 3 | 5 | 1 | 2 | 4 |
| 2 |  |  |  |  |  | Back | Pour Order | 4 | 1 | 2 | 3 | 5 |
| 3 |  |  | $\square$ | ven |  | Back | Pour Order | 2 | 3 | 5 | 1 | 4 |
| 4 |  | 2 | 3 | 5 |  | Front | Pour Order | 1 | 4 | 5 | 2 | 3 |
| 5 |  | 2 | ) |  |  | Back | Pour Order | 4 | 2 | 5 | 1 | 3 |
| 6 |  |  |  |  |  | Front | Pour Order | 3 | 5 | 4 | 1 | 2 |
| 7 |  |  |  |  |  | Back | Pour Order | 5 | 3 | 2 | 1 | 4 |
| 8 |  |  |  |  |  | Front | Pour Order | 5 | 2 | 4 | 3 | 1 |

## Make it Foolproof (or you'll feel like a fool later)

## Luck is the Residue of Preparation

$\square$ Make a test batch first if you can - this will highlight disturbances you haven't thought of, and any organizational issues.
$\square$ Pre-measure as many ingredients as possible.

## Surviving Murphy's Law

$\square$ What else could go wrong?
$\square$ If your data collection methods are well organized, you'll be able to keep track of the unexpected.
$\square$ Final Thought: Make it fun!

## Surprises in the Data

BP Amount

$$
y_{H}=72.54+2.50 x_{A}-2.95 x_{B}-1.76 x_{B} x_{D}
$$

$\uparrow$ muffin height $=$ use bread flour $+\downarrow$ baking powder $+\uparrow$ mixing time
