Overview of Separation Processes

- ▶ Why study separation processes?
- ▶ Economics of separation processes
- ▶ Some everyday examples
- ▶ Example flowsheet: Sugar production
- ▶ Separating agents
- ▶ Classification of separation processes

How to separate salts from water

- ▶ electrodialysis
- ▶ electrodeionization
- ▶
- ▶
- ▶
- ▶
- ▶
- ▶

Reference: [King](#), p 16

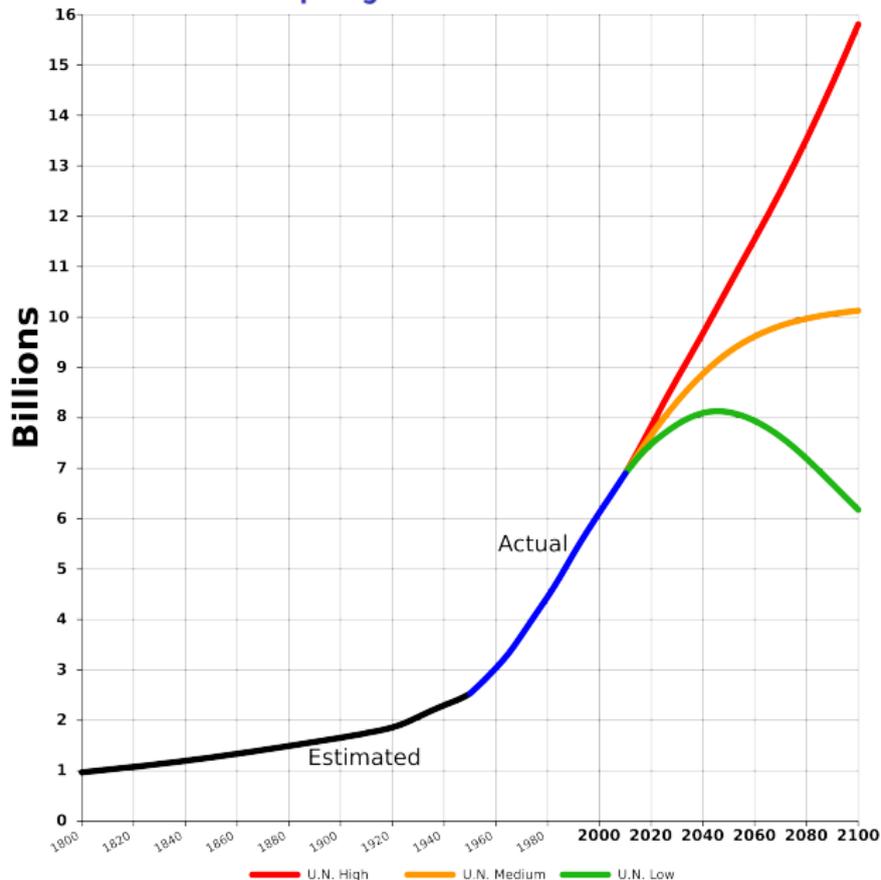

Usually there are multiple ways to achieve a required separation.

Why study separation processes?

- ▶ 50% to 90% of capital investment on petroleum and other chemical-reaction based flowsheets [King, p 15]
 - ▶ Expense often in proportion to the level of purity (called the **separation factor**) [Treybal, p 2]
- ▶ 60 to 100% of the ongoing operating costs in chemical plants
- ▶ Some important problems facing (the global) “us” are **separation problems**:
 - ▶ carbon capture and sequestration/storage (CCS) ... don't forget about methane
 - ▶ other air pollutants (e.g. cleaning small dust particles $\sim 5\mu\text{m}$)
 - ▶ access to clean water/sanitation

These problems will be an important part of your career, and impact your life, as the world's population approaches 8, 9 and then 10 billion in our lifetime (expected around 2050 to 2080).

World population: UN projections

Everyday examples

Separation processes at home:

- ▶ **screening**: sieve to strain water from pasta
- ▶ **absorption**: washing dishes/hands (fat dissolves into non-polar branch)
- ▶ **liquid/liquid extraction**: soak spices in oil to extract flavour
- ▶ **cyclone**:
- ▶ **filter**:
- ▶ **leaching**:
- ▶ **leaching**:
- ▶ **adsorption**:
- ▶ **centrifugation**:
- ▶ **phase change by heat addition**:
- ▶ **phase change by heat removal**:

Everyday examples

Separation processes in your body:

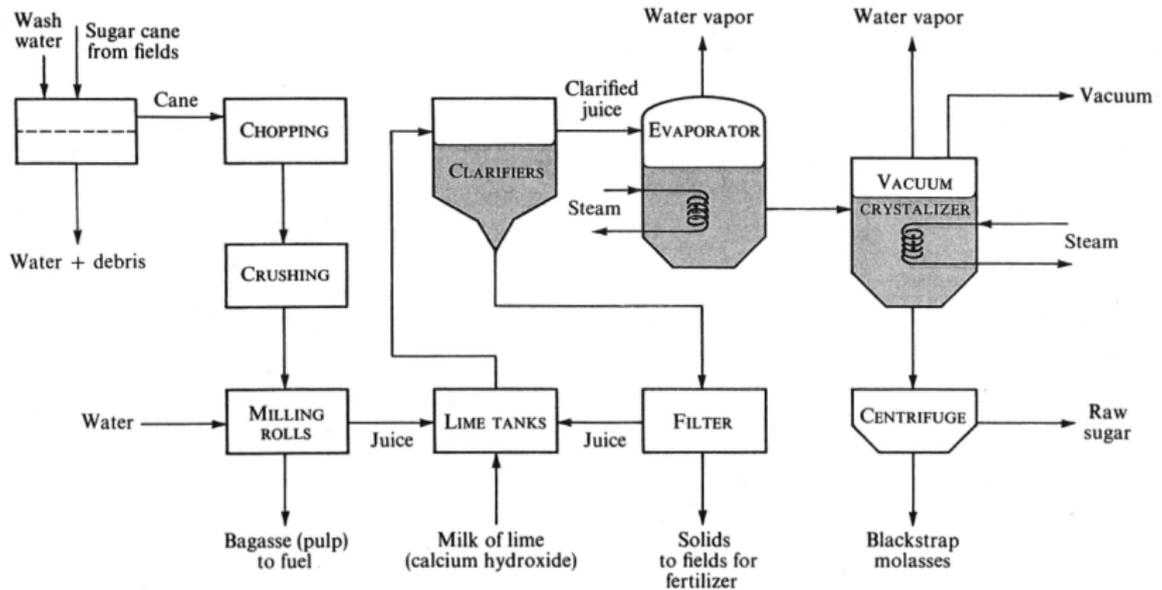

- ▶ kidneys: separates waste from blood; reabsorbs water and salts back into blood
- ▶ lungs: release of CO₂ from blood
- ▶ liver: breaks down toxins, excreted into bile
- ▶ gallbladder: concentrates bile
- ▶ intestines: absorb nutrients
- ▶ spleen: removes old red blood cells
- ▶ lymph nodes: filter foreign particles (e.g. cancers)

Engineering example

A common, everyday substance: sugar [King, p 2 to 9]

Topics that you want to cover

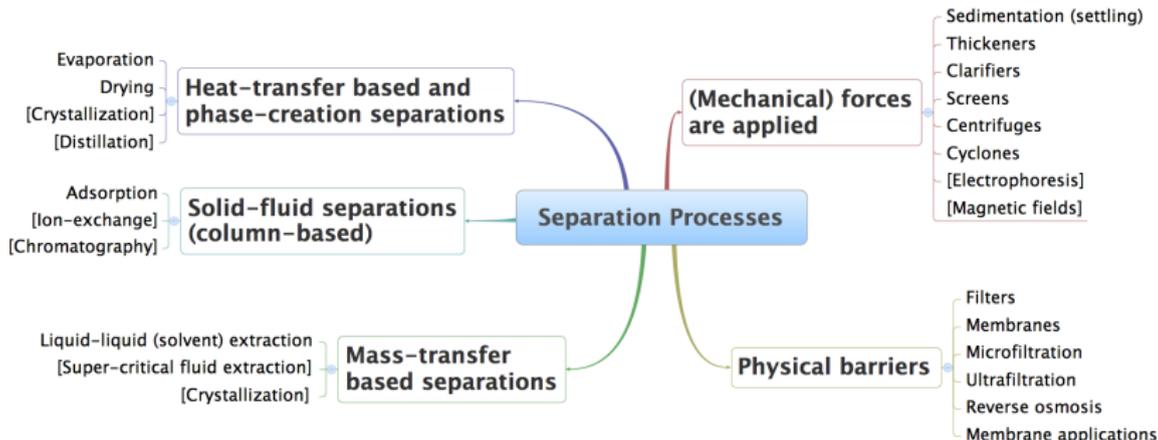

Based on the class activity last week, from highest to lowest:

- 7 Distillation, including flash, stripping column
- 5 Membranes, including reverse osmosis, nanofiltration
- 3 Filtration
- 3 Various types of waste water treatment (e.g. DEKA)
- 3 Centrifuges
- 3 Cyclones
- 2 Flocculation
- 1 Crystallization
- 1 Chromatography
- 1 Crystallization
- 1 Scrubbers (gas/solid/liquid)
- 1 Bioseparations
- 1 Leaching
- 1 Liquid-liquid extraction
- 1 Magnetic separation

How this course is structured

- ▶ We aim to consider a variety of separation systems
- ▶ Solids and (liquids and gases) = fluids
- ▶ Cover unit operations that rely on:
 - ▶ mechanical techniques to separate
 - ▶ mass transfer
 - ▶ phase creation or addition
 - ▶ heat transfer

Current plan for 4M3 in 2014

Bioseparations

- ▶ Many of the topics we will cover are part of a pure bioseparations course
- ▶ Often called “downstream” processing in the bio literature
- ▶ Only difference: they are operated under “bio-compatible” conditions: T , P , pH, aqueous media
 - ▶ i.e. all unit operations downstream of the bioreactors
- ▶ Unit operations include:
 - ▶ cell disruption: increase entropy!
 - ▶ centrifugation *
 - ▶ precipitation
 - ▶ adsorption and chromatography *
 - ▶ filtration *
 - ▶ membrane separation *
 - ▶ electrophoresis

* = a topic we will cover in 4M3

In this regard, you can see bioprocess separations are naturally designed and operated by chemical engineers.

How this course is structured

For each unit operation we consider

- ▶ the physical principle that causes separation
- ▶ basic concepts to size the unit and specify it; scale-up issues
- ▶ issues that affect the unit's cost
- ▶ troubleshoot problems with the unit
- ▶ how to optimize it (e.g. use less energy, increase separation efficiency, modify an existing unit's purpose)

Tutorial question: another way of looking at separations

Fill in various separation processes in these 9 rectangles:

| | | MINOR COMPONENT | | |
|-----------------|------------|-----------------|--------|------------|
| | | SOLID | LIQUID | GAS/VAPOUR |
| MAJOR COMPONENT | SOLID | | | |
| | LIQUID | | | |
| | GAS/VAPOUR | | | |

Separating agents: MSA and ESA

A material, force, or energy source applied to the feed for separation

i.e. what you add to get a separation. **MSA** = mass separating agent and **ESA** = energy separating agent

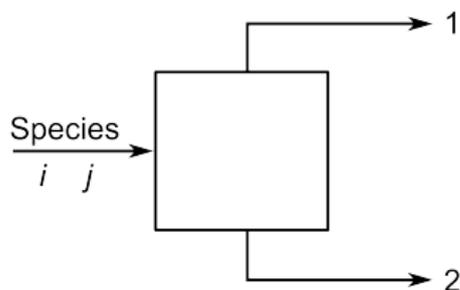

- ▶ heat (ESA)
- ▶ liquid solvent (MSA)
- ▶ pressure (ESA)
- ▶
- ▶
- ▶
- ▶
- ▶
- ▶
- ▶
- ▶

Separation factor

As mentioned, we will introduce a number of important principles we will re-use later.

Separation factor

$$S_{ij} = \frac{x_{i,1}/x_{j,1}}{x_{i,2}/x_{j,2}}$$

- ▶ select i and j so that $S_{ij} \geq 1$
- ▶ units of the x terms in the above equation can be mass or mole fractions (or flows)
- ▶ any units can be used, as long as you are consistent

Based on this definition: we can see why solid-fluid separations often have high separation factors
